## Thermochemistry II

Use the data table below, heating curves, dimensional analysis, and $q=m \times$ specific heat $\mathrm{x} \Delta T$ to solve the following problems.

| Substance | Specific Heat ( J/g $\cdot \mathrm{K}$ ) | $\begin{aligned} & \hline \text { MP } \\ & \left({ }^{\circ} \mathrm{C}\right) \\ & \hline \end{aligned}$ | $\begin{gathered} \Delta H_{\text {fus }} \\ (\mathrm{kJ} / \mathrm{mol}) \end{gathered}$ | $\begin{gathered} \hline \text { BP } \\ \left({ }^{\circ} \mathrm{C}\right) \\ \hline \end{gathered}$ | $\begin{gathered} \Delta H_{\text {vap }} \\ (\mathrm{kJ} / \mathrm{mol}) \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{Al}_{(s)}$ | 0.902 | 660 | 10.7 | *** | *** |

## SHOW YOUR WORK FOR EACH OF THE FOLLOWING. <br> WRITE YOUR ANSWERS IN JOULES. All processes occur at a constant pressure of 1 atm.

1. Calculate the amount of heat required to change 80.0 g of ice at $-12.0^{\circ} \mathrm{C}$ to steam at $114^{\circ} \mathrm{C}$.
2. How much heat is required to completely melt a $7.8-\mathrm{g}$ piece of copper metal from a $25.0^{\circ} \mathrm{C}$ solid to a liquid with a temperature of $1083{ }^{\circ} \mathrm{C}$ ?
3. How much heat is released when a $75-\mathrm{kg}$ sample of entirely molten iron, at $1535{ }^{\circ} \mathrm{C}$, is cooled to room temperature ( $22^{\circ} \mathrm{C}$ )?
4. Calculate the amount of heat required to fully vaporize a $30.00-\mathrm{mL}$ sample of mercury (density $=13.55 \mathrm{~g} / \mathrm{mL}$ ) starting from $22.0^{\circ} \mathrm{C}$. Is this process endothermic or exothermic?
5. How much heat is needed to change 57.1 mL of liquid ethanol at $20.0^{\circ} \mathrm{C}$ to a gas at $110^{\circ} \mathrm{C}$ ? (Assume density of ethanol $=0.789 \mathrm{~g} / \mathrm{cm}^{3}$.)
6. Calculate the amount of heat transferred when 2.0 L of water at $25.0^{\circ} \mathrm{C}$ (density $=$ $0.997 \mathrm{~g} / \mathrm{cm}^{3}$ ) is frozen to $-10.0^{\circ} \mathrm{C}$. Is this process exothermic or endothermic?
